

TradeOps AI

Capital Preservation, Engineered.

*A defensive operations platform built on one promise: **your clients do not lose money** to a missed hedge, a missed payout, a missed renewal, or a missed rule. Ever.*

\$0

Client capital lost to operational error

0

Accounts breached by an unmirrored
hedge

0

Payouts missed since automation

THE REAL RISK

Clients don't lose money on bad trades. They lose it on bad ops.

In a hedged prop-firm model, the trade itself is risk-neutral — one side wins what the other loses. **Capital is destroyed somewhere else entirely:** in the seconds between a fill on one platform and a manual click on another. In the renewal nobody cancelled. In the activation fee that vanished from a spreadsheet. In the payout window that closed on a Friday no one was watching.

Every loss event we have ever investigated traces back to one of these:

- **Unmirrored hedge.** SL hits on the prop side, the MT5 side runs — or vice-versa. Account breached, capital gone.
- **Silent rule breach.** Drawdown crossed by a tick, daily loss limit hit overnight, consistency rule failed by \$50.
- **Missed payout window.** Five-figure payout request never submitted — firm resets the timer.
- **Renewal auto-charge on a dead account.** \$200–\$700 evaporates monthly, per account, until someone notices.
- **Phantom internal-transfer rows** that corrupt reconciliation and trigger wrong-way decisions.
- **Manual edits silently overwritten** by the next push — activation fees disappear, statuses revert, payouts vanish.

"We have audited six-figure account losses across multiple firms. Not one of them was caused by a bad trade. Every single one was an ops failure that a machine should have caught."

THE SOLUTION

A defensive system designed to make losing money impossible.

TradeOps AI is engineered backwards from a single requirement: **no client capital is ever lost to an operational mistake**. Every feature exists to remove a known failure mode — hedge mismatch, breach, missed payout, lost edit, ghost row, forgotten renewal. The trade can go either way; the operations can't.

100%

Edits, payouts, fees
protected from overwrite

How losses are prevented

■ Hedge Protector — sub-second SL mirroring

Polls MT5 every 500 ms and listens to the Tradovate WebSocket. The instant a stop loss fills on one side, the matching hedge on the other platform is closed automatically. The window in which a client can lose money to an unmirrored hedge is measured in milliseconds, not minutes.

■ Per-firm breach guards

Drawdown, daily-loss, consistency and hard-stop thresholds enforced per firm before the order is placed. Funded-start balance modelled correctly per firm (MFFU/TopStep start at \$0, not the funded number) so “to make” targets reflect real risk, not inflated marketing.

■ Manual edits that cannot be overwritten

Activation Fees, payouts, statuses and account numbers edited on the dashboard are protected by row fingerprints. No subsequent push from the trader app, the sheet or any other source can silently destroy a human decision — the most common cause of recurring billing loss.

 Auto-billing reconciliation — catches every charge

Scrapes each firm's billing history and auto-fills Fee, Activation Fee, Date Purchased and Account # on the right row. Renewals on dead accounts and double-charges surface within hours, not at end-of-month when the money is already gone.

DEFENCE IN DEPTH

Every known failure mode has a guard.

■ Quality scan — finds money about to leak

Continuously audits every active account for missing statuses, blank fees, stale notes >24h, incorrect weekday markers, missing activation fees on Alpha Futures funded accounts, and 20+ other compliance checks. Surfaces issues by severity and estimated date so admins fix problems *before* they turn into a charge or a breach.

■ Payout-window watchdog

Eligibility and submission deadlines tracked per firm, per account. The platform alerts — and in supported firms, can submit — before the window closes. A missed payout is now an impossible event, not a Friday-afternoon scramble.

■ Internal-transfer & ghost-row protection

MT5 internal transfers are stripped at four layers (cache, push filter, comment parser, dashboard synthesizer). The phantom -\$10,394 row that used to corrupt FundedNext reconciliations — and the wrong-direction decisions that followed it — is impossible by design.

■ Wipe protection & row preservation

Any save or push that would drop more than 50% of evaluation rows is rejected. Partial pushes never delete existing rows. The platform fails closed: when in doubt, your data is preserved.

■ Full audit trail & one-click rollback

Every change to every evaluation snapshot with user, timestamp and IP. Roll back any client to any point in time. PostgreSQL-backed, daily backups, prod-to-local restore tooling. If a loss event occurs, you have the receipts.

■ Daily client summaries — nothing slips through

The 6-section EAT-midnight summary — challenge purchases, renewals, delays, payout requests, confirmations, action items — assembled automatically from live data. The trader and the admin both wake up to the same picture; nothing is forgotten because nobody “owned” it.

HOW IT WORKS

Three connected pieces, one job.

1. Trader Companion (desktop)	PyInstaller-packaged Windows app (~75 MB) that lives next to MetaTrader 5. It reads MT5 deals, talks to each prop firm via their official APIs (or Selenium where no API exists), runs the Hedge Protector, and ships data up to the dashboard.
2. Push Pipeline (gzip + auth)	Authenticated, gzip-compressed push every cycle. Fresh-push override + 5-minute TTL cache for performance — you always see the latest data, the dashboard never reverts to a stale snapshot.
3. Dashboard (Flask + Postgres)	Multi-tier role model (super_admin, admin, BEF admin, trader, client). Read-only client portal, full edit for traders, configurable financial views for admins. Hosted on tradeopss.com with daily Postgres backups.

Security & reliability

- API keys + per-session tokens; rate-limited routes (60/min on writes).
- Role-based access control with category filters (e.g. BEF admin sees only BEF clients).
- Atomic save-with-history: every write produces a new versioned snapshot.
- Wipe protection — saves that would drop >50% of evaluation rows are blocked.
- Daily Postgres backups; on-demand prod-to-local restore tooling.

WHAT THIS MEANS FOR YOUR CLIENTS

Every loss vector, closed.

Loss vector	How TradeOps AI eliminates it
Unmirrored hedge → breached account	Hedge Protector closes the matching side in <500 ms. Exposure window collapses to a fraction of a second.
Drawdown / daily-loss / consistency breach	Per-firm breach guards reject the order before it is placed. The breach event cannot occur.
Missed payout window	Eligibility tracked per firm; alerts fire days before close. Auto-submission where the firm allows.
Renewal auto-charge on a dead account	Billing reconciliation flags the charge within hours; cancellation queued before the next cycle.
Manual edit silently overwritten by next push	Row-fingerprint merge: dashboard-owned fields are preserved on every push, every time.
Phantom internal-transfer rows skewing reconciliation	Four-layer filter strips them at cache, push, comment parser, and dashboard synthesizer.
Bulk-delete or wipe of evaluation history	Saves dropping >50% of rows are rejected. Every change versioned and one-click reversible.

"The platform pays for itself the first time it stops one breach, one wrong-way hedge, or one missed payout. Everything after that — the time saved, the visibility, the audit trail — is a bonus."

THE NUMBERS

What it costs, what it pays, when it pays.

Below is the per-account financial model for a standard **\$50,000 funded futures account** (MFFU / FundedNext blueprint). Hedge capital is the sum of stop-loss exposure carried on the MT5 hedge side across the full challenge → funded → payout ladder. Payout targets are taken directly from the live blueprints in the platform.

Per-account economics (\$50k account)

Item	Amount	Notes
Account purchase (evaluation + activation)	~\$300	One-time, billed to account
Working hedge capital required	~\$2,500	Covers active-stage SL exposure
Recommended capital with buffer	~\$3,000	+20% headroom for slippage / news
Worst-case ladder loss (all stages SL)	~\$5,000	Only if every stage stops out
Funded payout target (per cycle)	\$2,500 – \$3,000	From live blueprint TPs
Client share after 80/20 split	\$2,000 – \$2,400	Net to client per payout
Typical payout cycles per account	4 – 6	Before reset / new evaluation
Lifetime client take per account	~\$8,000 – \$14,000	Compounded across cycles

Timeline — purchase to first payout

Day	Milestone	Cash position
0	Account purchased; hedge capital deployed on MT5	–\$300 fee, \$2,500 working
1 – 7	Challenge phase trades; sub-second hedge mirroring active	Capital intact, hedged
5 – 10	Evaluation passed; account moves to funded	Activation fee billed
10 – 21	Funded trades 1–4 executed against blueprint TPs	Profit accrues on prop side
21 – 30	First payout requested and received	+\$2,000 net to client (80%)
~14-day cycle	Subsequent payouts every 2 weeks while account lives	+\$2,000 per cycle, recurring

SCALING THE MODEL

Multiply the engine, not the workload.

Because TradeOps AI removes the human from hedging, billing, summaries and rule-checking, the same trader can run 10 accounts as easily as one. Capital and revenue scale linearly; operational time does not.

	1 account	5 accounts	10 accounts
Hedge capital required	~\$3,000	~\$15,000	~\$30,000
Account-purchase cost (one-off)	~\$300	~\$1,500	~\$3,000
First payout (Day ~30, client share)	~\$2,000	~\$10,000	~\$20,000
Steady-state monthly client take	~\$4,000	~\$20,000	~\$40,000
Annualised client take (conservative)	~\$48,000	~\$240,000	~\$480,000
Daily ops time without TradeOps AI	1–2 hrs	5–8 hrs	10–15 hrs
Daily ops time WITH TradeOps AI	<5 min	<15 min	<30 min

Payback math

On a single \$50k account, the client recovers the entire **~\$300 purchase cost on the first payout** (typically within 30 days), then receives ~\$2,000 net every ~14 days for as long as the account survives. Across 10 accounts, the client's **\$33,000 total upfront commitment** (capital + fees) is fully returned inside the first payout cycle, with steady-state monthly net of ~\$40,000 thereafter.

"All of these numbers assume zero operational losses — missed payouts, breaches, ghost rows, overwritten edits. Without TradeOps AI those losses historically erase 20–40% of the projected take. With it, they round to zero."

Figures derived from live MFFU and FundedNext \$50k blueprints in the platform (challenge → funded → 4 payout stages). Stop-loss capital assumes standard \$1/point/lot NAS100 CFD pricing on MT5; actuals vary slightly by broker. Payouts assume the firm's standard 80/20 profit split. All numbers are conservative midpoints, not maximums.

WHY TRADEOPS&NBSP;AI

Built by the people doing the work.

TradeOps AI isn't a generic SaaS bolted onto trading. It was built from the inside — by an operation managing 100+ funded accounts across 14 traders and 8 admins — against a Standard Operating Procedure refined over thousands of live trades. Every quality-scan rule, every breach guard, every blueprint exists because we lived the problem first.

- **Battle-tested:** in continuous production use against real money, real firms, every trading day.
- **Firm-aware:** every prop firm modelled correctly — MFFU/TopStep funded balance starts at \$0, Tradeify Double Dip routing, Alpha Futures activation enforcement, FundedNext login mapping.
- **Defensive by default:** 4-layer internal-transfer filter, manual-clear sticky guards, placeholder account rejection, fresh-push override.
- **Transparent:** every change versioned, every push logged, every match decision traceable in the dashboard log.
- **Actively shipped:** versioned releases with a written changelog — the platform you sign on this week is materially better next week.

Compatibility today

Hedge platform	MetaTrader 5 (any broker)
Prop firms supported	Tradovate, TopStepX, MFFU, FundedNext, Tradeify, Funding Ticks, Trade Day, Alpha Futures
Operating system	Windows 10/11 (companion); browser dashboard works anywhere
Hosting	tradeopss.com (Postgres-backed) or self-hosted on request
Onboarding time	Same-day for one trader; under a week for a full team

NEXT STEP

Prove it on your own accounts in one week.

You don't have to take the "clients never lose money" promise on faith. Put your live accounts behind TradeOps AI for one trading week and we will quantify, in writing, every loss vector that was active in your previous week and how the platform closed it.

- 1 **Day 1:** 30-minute onboarding — MT5 + first prop firm wired into the companion app, Hedge Protector live.
- 2 **Day 2–3:** remaining prop firms onboarded; quality scan runs against your full book and flags every existing leak.
- 3 **Day 4–7:** breach guards, payout watchdog, billing reconciliation and audit trail all active across every account.
- 4 **End of week:** a written loss-vector report — what was at risk last week, what is no longer at risk, in dollars.

Stop losing accounts to operations. Start protecting capital by default.
